```

## 2.10 Flow Method

```
Maximize c^T x subject to Ax ≤ b, x ≥ 0;
with the corresponding symmetric dual problem,
Minimize b^T y subject to A^T y ≥ c, y ≥ 0.

Maximize c^T x subject to Ax ≤ b;
with the corresponding asymmetric dual problem,
Minimize b^T y subject to A^T y = c, y ≥ 0.

General Graph:
|Max Ind. Set| + |Min Vertex Cover| = |V|
|Max Ind. Edge Set| + |Min Edge Cover| = |V|
Bipartite Graph:
|Max Ind. Set| = |Min Edge Cover|
|Max Ind. Edge Set| = |Min Vertex Cover|

To reconstruct the minimum vertex cover, dfs from each
unmatched vertex on the left side and with unused edges
only. Equivalently, dfs from source with unused edges
only and without visiting sink. Then, a vertex is
chosen iff. it is on the left side and without visited
or on the right side and visited through dfs.
```

```
Minimum Weighted Bipartite Edge Cover:
Construct new bipartite graph with n+m vertices on each
    side:
for each vertex u, duplicate a vertex u' on the other
    side
for each edge (u,v,w), add edges (u,v,w) and (v',u',w)
for each vertex u, add edge (u,u',2w) where w is min
    edge connects to u
then the answer is the minimum perfect matching of the
    new graph (KM)

Maximum density subgraph ( \sum{W_e}+ \sum{W_v} ) / |V|
Binary search on answer:
For a fixed D, construct a Max flow model as follow:
Let S be Sum of all weight( or inf)
1. from source to each node with cap = S
2. For each (u,v,w) in E, (u->v,cap=w), (v->u,cap=w)
3. For each node v, from v to sink with cap = S + 2 * D
    - deg[v] - 2 * (W of v)
where deg[v] = \sum weight of edge associated with v
If maxflow < S * |V|, D is an answer.

Requiring subgraph: all vertex can be reached from
    source with
edge whose cap > 0.

Maximum closed subgraph
1. connect source with positive weighted vertex(capacity
    =weight)
2. connect sink with negitive weighted vertex(capacity=-
    weight)
3. make capacity of the original edges = inf
4. ans = sum(positive weighted vertex weight) - (max
    flow)

Minimum Path Cover of DAG
1. For each vertex v, split it to v_in and v_out.
2. For each edge (u->v), add an edge between u_out and
    v_in
3. |Minimum Path Cover| = |V| - |Maximum Matching| of
    the new bipartite graph
```

```

## 3.18 Result

- Lucas' Theorem :
  For $n, m \in \mathbb{Z}^*$ and prime $P$, $C(m,n)$ mod $P = \Pi(C(m_i, n_i))$ where $m_i$ is the $i$-th digit of $m$ in base $P$.
- 1st Stirling Numbers(permutation $|P| = n$ with $k$ cycles):
  $S(n,k)$ = coefficient of $x^k$ in $\Pi_{i=0}^{n-1}(x+i)$
  $S(n+1,k) = nS(n,k) + S(n,k-1)$
- 2nd Stirling Numbers(Partition $n$ elements into $k$ non-empty set):
  $S(n,k) = \frac{1}{k!}\sum_{j=0}^{k}(-1)^{k-j}\binom{k}{j}j^n$
  $S(n+1,k) = kS(n,k) + S(n,k-1)$
- Calculate $f(x+n)$ where $f(x) = \sum_{i=0}^{n-1} a_i x^i$:
  $f(x+n) = \sum_{i=0}^{n-1} a_i(x+n)^i = \sum_{i=0}^{n-1} x^i \cdot \frac{1}{i!}\sum_{j=i}^{n-1}\frac{a_j}{j!}\cdot\frac{n^{j-i}}{(j-i)!}$
- Calculate $c[i-j] += a[i] \times b[j]$ for $a[n], b[m]$
  1. a=reverse(a); c=mul(a,b); c=reverse(c[:n]);
  2. b=reverse(b); c=mul(a,b); c=rshift(c,m-1);
- Eulerian number(permutation $1 \sim n$ with $m$ $a[i] > a[i-1]$):
  $A(n,m) = \sum_{i=0}^{m}(-1)^i\binom{n+1}{i}(m+1-i)^n$
  $A(n,m) = (n-m)A(n-1,m-1) + (m+1)A(n-1,m)$
- Derangement:
  $D(n) = (n-1)(D(n-1)+D(n-2)) = nD(n-1)+(-1)^n$
- Pick' s Theorem : $A = i + b/2 - 1$
- Euler Characteristic:
  planar graph: $V - E + F - C = 1$
  convex polyhedron: $V - E + F = 2$
  $V, E, F, C$: number of vertices, edges, faces(regions), and components
- Kirchhoff's theorem :
  - number of spanning tree of undirected graph:
  degree matrix $D_{ii} = deg(i)$ , $D_{ij} = 0$
  adjacency matrix $G_{ij} = \#\ of\ (i,j) \in E$ , $G_{ii} = 0$,
  let $A = D - G$, delete any one row, one column, and cal $det(A')$
  - number of spanning tree of directed graph:
  in-degree matrix $D^{in}_{ii} = indeg(i)$ , $D^{in}_{ij} = 0$
  out-degree matrix $D^{out}_{ii} = outdeg(i)$ , $D^{out}_{ij} = 0$
  let $L^{in} = D^{in} - G$ , $L^{out} = D^{out} - G$ , delete the $i$-th row and column
  $det(L^{in}_i)$ and $det(L^{out}_i)$ is the number of spanning tree from/to root $i$
- Burnside Lemma: $|X/G| = \frac{1}{|G|}\sum_{g\in G}|X^g|$
- Polya theorem: $|Y^x/G| = \frac{1}{|G|}\sum_{g\in G} m^{c(g)}$
  $m = |Y|$ : num of colors, c(g) : num of cycle
- Anti SG (the person who has no strategy wins) :
  first player wins iff either
  1. SG value of ALL subgame $\leq 1$ and SG value of the game $= 0$
  2. SG value of some subgame $> 1$ and SG value of the game $\neq 0$
- Möbius inversion formula :
  $g(n) = \sum_{d|n} f(d)$ for every integer $n \geq 1$ , then
  $f(n) = \sum_{d|n}\mu(d)g(\frac{n}{d}) = \sum_{d|n}\mu(\frac{n}{d})g(d)$ for every integer $n \geq 1$
  Dirichlet convolution : $f*g = g*f = \sum_{d|n} f(d)g(\frac{n}{d}) = \sum_{d|n} f(\frac{n}{d})g(d)$
  $g = f*1 \Leftrightarrow f = g*\mu$, $\epsilon = \mu*1$, $Id = \phi*1$, $d = 1*1$, $\sigma = Id*1 = \phi*d$,
  $\sigma_k = Id_k*1$ where $\epsilon(n) = [n=1]$, $1(n) = 1$, $Id(n) = n$, $Id_k(n) = n^k$,
  $d(n) = \#(divisor)$, $\sigma(n) = \sum divisor$, $\sigma_k(n) = \sum divisor^k$
- Find a Primitive Root of $n$:
  $n$ has primitive roots iff $n = 2, 4, p^k, 2p^k$ where $p$ is an odd prime.
  1. Find $\phi(n)$ and all prime factors of $\phi(n)$, says $P = \{p_1, ..., p_m\}$
  2. $\forall g \in [2, n)$, if $g^{\frac{\phi(n)}{p_i}} \neq 1, \forall p_i \in P$, then $g$ is a primitive root.
  3. Since the smallest one isn't too big, the algorithm runs fast.
  4. $n$ has exactly $\phi(\phi(n))$ primitive roots.
- Sum of Two Squares Thm (Legendre):
  For a given positive integer $N$, let
  $D1 = (\#$ of $d \in N$ dividing $N$ that $d = 1 \pmod 4)$
  $D3 = (\#$ of $d \in N$ dividing $N$ that $d = 3 \pmod 4)$
  then $N$ can be written as a sum of two squares in
  exactly $R(N) = 4(D1 - D3)$ ways.
- Difference of $D1 - D3$ Thm:
  let $N = 2^t \times [p_1^{e1} \times ... \times p_r^{er}] \times [q_1^{f1} \times ... \times q_s^{fs}]$
  where $p_i \in mod\ 4 = 1\ prime$ , $q_i \in mod\ 4 = 3\ prime$
  then $D1 - D3 = \begin{cases}(e1+1)(e2+1)...(er+1) & if\ f_i\ all\ even\\ 0 & if\ any\ f_i\ is\ odd\end{cases}$
- Sherman-Morrison formula:
  suppose $A \in \mathbb{R}^{n\times n}$ is invertible and $u, v \in \mathbb{R}^n$
  $A + uv^T$ is invertible if and only if $1 + v^T A^{-1} u \neq 0$
  $(A+uv^T)^{-1} = A^{-1} - \frac{A^{-1}uv^TA^{-1}}{1+v^TA^{-1}u}$

### 5.16 Graph Method

Manhattan MST
For each point, consider the points that surround it(8 octants). Then, connect it with the closest point. For example, consider 45~90. For each point p, the closest point is min{x+y | x-y >= p.x-p.y, x >= p.x }. Finally, the answer is this new graphs(E=4N) MST.
